INTERVIEW SUMMARY

This is to summarize an interview between Examiner Klinger and Attorney England on
March 22, 2005.

The Examiner and Attorney discussed by telephone the second Office action, dated
February 24, 2005, finally rejecting all remaining claims and citing additional references,
"Crawler-Friendly Web Servers" September 2000, ("Brandman") and U.S. Patent No. 6,735,169
("Albert").

Examiner clarified that Brandman is relied upon in the rejection of claim 1 in the present
case for its teaching about a server dynamically generating a web page in response to a crawler
requesting the page. Attorney contends that this does not teach that when a reference in a web
page is specified by a script to produce an address for a next page the address is determined for
the next page by the browser executing the reference and sending the address to the crawler, as
claimed, particularly since a browser is something on the client.

Docket AUS920000510US1

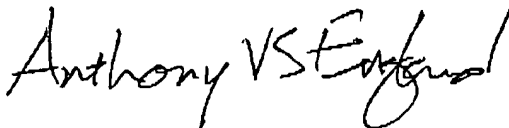

Appl. No.: 09/736,349
Filing Date: December 14, 2000

Also, Attorney pointed out that this executing of a reference on a web page to obtain the referenced address of another page is enabled by parsing the reference from one of the web pages by the crawler program and sending the reference to an applet running in the browser, as claimed, and since the applet is running in the browser this is also on the client.

Attorney pointed out that this executing of a reference on a web page to obtain the referenced address of another page is also enabled by a spoof proxy feature of the invention set out in claim 2, for example. Examiner indicated that he is relying on the forwarding agent interposed between the client and host in Albert as shown in FIG's 3A, 3B and 3C for the rejection of claim 2. Attorney pointed out that Albert does not teach about a resolver file on the client that has an address for the host which is different than the actual address of the host, as claimed. This spoofing of the address as described in claim 2 of the present case enables the applet running in the browser to execute the reference, as described in claim 1. That is, security constraints for browsers ordinarily would prevent the applet to execute a reference if the applet did not come from the host that sourced the web page having the reference.

The Examiner said he is considering allowing claims 6 and 7, and their counterparts.

Respectfully submitted,

Anthony V. S. England
